Intra-Industry and Inter-Industry Trade and Specialization in Portugal: 1989-1992.

ABSTRACT: This paper presents a measurement of intra and inter-industry trade and specialization in the Portuguese foreign trade in 1989-1992. It uses both Balassa's "B" Index and the Aquino "Corrected" Coefficient. Intra-industry trade increased, but was partially reversed at the end of the period. This was probably due to the recession and declining imports.

1. Introduction.

This paper tries to provide some evidence on the problem of inter-industry and intra-industry specialization on the Portuguese trade in 1989-1992. This was a period of serious and widening imbalances in the balance of trade.

The distinction between inter-industry specialization and intra-industry specialization (or "two-way trade"³) is by itself essential, since it is linked to different market structure.

Furthermore, the amount of trade associated to intra-industry trade can be surprisingly great. Both Hipple⁴ and UNCTC⁵ reach the conclusion that over a third of US trade flows is intra-industry related (Hipple's figures are 34.2% for all foreign trade in 1982). Bonturi & Fukasaku⁶, using OECD trade data for the US and Japan in overseas trade, point to 33.5% in 89 for intra-industry trade in the USA (their series from the US goes from 1977 to 1989, and the ratio is a fairly stable one, around a third of total trade), and to 32.7% (exports) and 28.7% (imports) for the Japanese foreign trade in 89.

³Of course that depends on the degree and kind of homogeneity in each statistical group considered. They are not always (to say the least) constructed according to an economic logic: namely, regarding the elasticity of substitution between products.

2. Portuguese Trade Patterns.

The 1989-1993 period was characterized by a persistent, large and growing trade deficits of the Portuguese balance of trade⁷ with respect to all groups of countries considered by us: the World (total external trade), the OECD countries (Organization for Economic Cooperation and Development), the EU countries (European Union, only the 12), the EFTA countries (European Free Trade Association) and Non-OECD Countries, that is, the World minus the OECD countries (see Table I below).

The trade coverage ratio (TCR), that is, exports divided by imports declined from 65% to 60% in 1988/92, and Portugal enlarged its trade imbalance, with all countries' groups considered above. This deficit prevailed even regarding EFTA, with whom Portugal had traditionally a trade balance surplus. The higher variability of the trade coverage ratio with the Non-OECD Countries reflects partially the declining oil prices and huge changes on trade with countries such as Angola - a former Portuguese African colony - in 1992.

In fact, at 2-digits level of the Combined Nomenclature (the standard system of trade classification used by the European Union), less than a quarter of the 99 industries covered show a surplus on trade balances (see Table II next page).

⁷Due to the absence of a real monetary union (that is, the persistence of exchange rate risk in foreign trade) within the European Union, trade with EU's partner countries is still counted in this paper as imports and exports, and not, as by the INE, as "arrivals" and "departures".

⁸ This data -since its going to be used on trade specialization calculations- is on trade of goods only. Services are not included.

62: ARTICLES OF APPAREL AND CLOTHING ACCESSORIES , NOT KNITTED OR CROCHETED
63: OTHER MADE UP TEXTILE ARTICLES; SETS; WORN CLOTHING AND WORN TEXTILE ARTICLES; RAGS
64: FOOTWEAR, GAITERS AND THE LIKE; PARTS OF SUCH ARTICLES
65: HEADGEAR AND PARTS THEREOF
66: UMBRELLAS, SUN UMBRELLAS, WALKING-STICKS, SEAT-STICKS, WHIPS, RIDING-CROPS AND PARTS THEREOF
70: GLASS AND GLASSWARE
89: SHIPS, BOATS AND FLOATING STRUCTURES
93: ARMS AND AMMUNITION; PARTS AND ACCESSORIES THEREOF
99: OTHER PRODUCTS

The exporting industries are those related to natural resources, and "traditional" industries (like textiles, footwear, apparel, glass and boats).

⁹For the meaning of each industry's classification, see Annex I.

They are essentially labor-intensive industries, reflecting the relative factor endowment.

3. Techniques of Measurement of Trade Concentration

We begin our analysis by calculating the most traditional measure of trade specialization, the so called Balassa's "B" coefficient (see Balassa, 1974), This is defined as

$$B = (1/n) \sum_k^n [|X_k - M_k| / (X_k + M_k)]$$

where

X_k = Portugal's exports of product k to the group of countries considered.

M_k = Portugal's total imports of product k from the group of countries considered.

n = total number of products.

It is easy to see that, when $\sum X_k$ differs too much from $\sum M_k$, the Balassa "B" coefficient is biased toward unity. That is, it overestimates inter-industry specialization. Aquino (1978), among others¹⁰ proposed a corrected coefficient¹¹, defined as

$$A = \frac{\sum_{i=1}^n |X_i^e - M_i^e|}{\sum_{i=1}^n (X_i + M_i)}$$

where

$$X_i^e = \frac{X_i \sum_{i=1}^n (X_i - M_i)}{2 * \sum_{i=1}^n X_i}$$

and similarly for M_i^e ¹².

¹⁰See Glejser, H.; 1982.

¹¹Balassa himself recognized the *bias* of its coefficient, and provided later an interesting corrected version of it in a paper with Bauwens. See Balassa, B. & Bauwens, L.; 1988.

¹²We must note that Glejser also criticizes a possibly *bias* in the Aquino's corrected coefficient and develops its own version. We will, nevertheless, restrict our results in this paper to the first version of the Balassa's coefficient and to the Aquino's "corrected" version. See Glejser, H.; *ibid*.

4. Data and Results.

We used data for all 99 2-digit sectors of the Combined Nomenclature, that covered the primary and secondary sectors (see Annex I), for the period 1989 to 1992.

The Portuguese coefficients are also shown for the following aggregates: the World (total external trade), the OECD countries (Organization for Economic Cooperation and Development), the EU countries (the European Union, only the 12), the EFTA countries (European Free Trade Association) and Non-OECD Countries (that is, the World minus the OECD countries). The results are show below¹³.

B,A = 1: total inter-industry specialization; 0: total intra-industry specialization.
sources: Eurostat; INE (Portuguese National Institute of Statistics).

We may note that the results for the Balassa Index are almost textbook results: Portugal has a higher index for intra-industry trade (that is, a low coefficient) the more similar (and more developed) is the partner-aggregate's productive structure. The coefficients are also fairly stable during the period covered.

Yet, the results for the Aquino's coefficient seem to be much more revealing and also somewhat surprising: they show a marked trend *toward* intra-industry concentration especially during the initial three years (1989/91). This seems to be a natural consequence of the Portuguese integration process in the European Union, of a more liberalized economy regarding imports.

¹³Desegregated results by individual industries and industry sectors are available from the author on request.

These trends may also be due to the to the opening of full industries closed up to recently, such is the case of the industries which were closed up to 1986 and that were only partially opened during the transition period for membership. These industries were only fully opened in 1989. They are industries with large economies of scale, which is the most important source of intra-industry trade¹⁴. The substantial increase in FDI after 1988 and a slowdown in 1992/94 may also explain these trends in intra-firm and intra industry trade.

The majority of the reversal in 1992 seems to be due to the fall of intra-industry trade with the EU's partner-countries. The EU is, by far, the most important external market for Portuguese goods, absorbing over three-quarters of the Portuguese exports of goods during the period. The coefficient rises almost 50% in only one year, probably as a side-effect of the cyclical downturn in the Union, dragging the whole index down with it. The higher volatility of the coefficient for the Non-OECD Countries is a natural consequence of its instability.

To test the consistency of our results, we used also data for all 4-digit sectors of the Combined Nomenclature (over 1200 industries), that covered also the primary and secondary sectors, for same period and the same groups of countries. The results are show below¹⁵.

The results for 4-digit level confirm the results obtained at 2-digit level, except in one important point: the trend toward intra-industry concentration in trade is a steady one during the whole period. There a certain loss in the speed of the trend in 91/92, but no reversal, at least during the first years of the economic downturn in continental Europe.

Further data for the following years will show if this trade trend has continued, or if its reversal or loss of speed were only temporary side-effects of the recent European economic downturn on its periphery.
